Ambulance Drone Support System (ADSS)

Abstract:—

Thousands of people die because of Ambulance Delays. The time taken by ambulance to reach a patient depends a lot on the route, distance and the traffic en route. The helicopter support is working in certain places, but requires a lot of money, and open space for landing. What if there was a way to support the patient to survive long enough for the ambulance to arrive. The Ambulance Drone Support System is a way by which we can support a patient long enough for the ambulance to come and take matters in hand from there.
